The sequence contained an oligo-dT track that was present in the cligonucleotide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A tail. The sequence tag present in the cDNA between the NotI site and the oligo-dT track served to verify it as a clone from the non-normalized ovary at estrus day 12 library CDNA Library preparation: RJ Woods, JA Green, RS Prather S142 Animal Science Missouri-Columbia, 65211 Clone distribution: Glones will be available through Research Genetics (www.resgen.com) The following repetitive elements were found in this cDNA sequence: 1-28, Seq primer: MI3 Forward

POLYA-Yes.

/note="Vector: pT73D-Pac (Pharmacia) with a modified
polylinker; 1st strand cDNA was prepared from mammary
gland tissue from a lactating female, and was then primed
with a Not I - oligo(dT) primer. Double-stranded cDNA was
ligated to Eco RI adaptors (Pharmacia), digested with Not
I and cloned into the Not I and Eco RI sites of the
modified pT73J vector. Library is normalized. Library
was constructed by Bento Soares and M. Fatima Bonaldo."

The sequence tag present in the cDNA between the Norls site and the oligo-dT track served to identify it as a clone from the normalized pineal glands library cDNA Library Preparation: M.B. Soares Lab Clone distribution: NIH BMAP cDNA clones will be made available by the means for distribution of the BMAP cDNA clones, this record will be updated accordingly when that means is determined. BOUNA-Yes.

/note="vector: pBlueScript II (SK-); Site_l: ECORV; C.
parvum (104A isolate) genomic DNA was hydrodynamically
sheared to produce fragments having a tight size
distribution between 2-4 kb by Dr. Yvonne Thorstenson of
the Stanford DNA Sequencing and Technology Center
(http://sequence-www.stanford.edu/group/techdev/shear.htm). The randomly sheared gDNA was chromatographed on
Sephacryl S-400 to remove any small fragments and DNA
eluting in the void volume was subcloned into an ECOR
V-digested, alkaline phosphatase-treated pBlueScript II
(SK-) vector and transformed into E. coli strain XL2 Blue
MRF'. Recombinant clones from the first plating of the
library were selected for sequence analysis using T3 and
T7 primers."

High-efficiency full-length cDNA cloning. Methods Enzymol. 303, 19-44 (1999)
contributed to prepare mouse tissues. Ist strand cDNA was parimed with a primer [5′ acdsGAGGAGGGGGCGACTCGAGTTTTTTTTTTTTTTVN 3′], cDNA was prepared by using trehalose thermo-activated reverse transcriptase and subsequently enriched for full-length by cap-trapper. Second strand cDNA was prepared with the primer adapter of sequence [5′ adapter of sequence [5′ adapter of sequence [5′ adapter of sequence [5′ adapter 10′ se
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              EST 30-JUN-2000

                                                                                                                                                                                                                                                                A simian species of IL-15 (aIL-15) was purified and its AA sequence and cDNA sequence analysed (see AAR83309, AAR83436, AAT00524, AAT00525). Both the simian and the human ORFs encode a precursor polypeptide (AAR83436, AAR8438). The precursor polypeptide (AAR83436, AAR8438). The precursor polypeptide (AAR83436, AAR8438). The precursor polypeptide and a factor sequence and a sequence encoding mature simian or human IL-15 polypeptides are disclosed in AAR83309 & AAR83310 respectively. The invention also comprises other mammalian IL-15, including human IL-15, that hybridise to probes defined by AAR83438. A plasmid contg. a recombinant clone of human IL-15 cDNA was deposited with ATCC on Feb. 19 1993 under ATCC 69245. The deposit was named 141-HETF. AAR83315 is a mammalian mature IL-15 polypeptide. It is a generic sequence which encompasses both AAR83309 (simian) and AAR83310 (human) IL-15 mature polypeptides.
                                                                                                                                                                            Isolated DNA encoding polypeptide with mammalian IL-15 activity - which stimulates proliferation and differentiation of T cells, used for treating carcinoma(s), melanomas, etc. and viral infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              420

                                                                                                                                                                                                                            primers were designed based on the sequence information. A 92 bp fragment was amplified from CV1/EBNA DNA and was used as a probe to screen a CV1/EBNA cDNA library for the full-length sETF coding sequence (1.e. the present sequence). Mature SETF induces proliferation and/or differentiation of precursor or mature T cells and is useful for promoting long-term in vitro culture of T-lymphocytes and T-cell lines. It is used for treating
                 The simian ETF (epithelium derived T cell factor) was isolated from African green monkey CV1/EBNA cell conditioned medium. The N-terminal sequence of the purified sETF was determined and then PCR

This is the nucleotide sequence encoding a human epithelium-derived the Corresp. After The gene was obtained using a 1.37 kb fragment of the corresp. Aftican green monkey gene (AAA12225) as a probe to screen a cDNA ilbrary constructed from RNA derived from the IMTLH cell line. This cell line is derived by stable transformation of a human bone marrow stromal cell culture with psylace. From a pool of about 1000 cDNA clones, one clone 14. InETF contained this sequence. ETF is a protein of proliferation and/or differentiation of precursor and/or mature T cells. The protein is therefore useful for promoting long term in vivo culture of T-lymphocytes and T-cell lines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                240

Muteins of human IL-15 or simian IL-15 (see also AAR89526) are useful as antagonists of IL-15 and can be prepd. by PCR-mediated mutagenesis of the encoding sequences. Preferred muteins have amino acid substitutions at Asp56 and/or Gln156 of the IL-15 protein that prevent signal transduction. They are useful for treating graft-versus-host
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antagonists of interleukin-15 - are used to treat patients having symptoms of graft-versus-host disease and for prolonging allo:graft survival

This sequence encodes human interleukin-15 (IL-15), which can be used in the vaccine of the invention. The vaccine composition comprises an immunogenic amount of a vaccine antigen (49) and an immunogenicity-augmenting amount of IL-15. The composition is useful for enhancing the immunogenicity of a vaccine. The cytokine IL-15 is a potent T and B cell growth factor. It causes proliferation and differentiation of these cells and augments T cell mediated immune responses. The vaccine composition can sufficiently elicit an immune response without being deleterious to the recipient, especially when using pathogenically deficient antigens. Some vaccines do not elicit a strong immune response and cannot provide sufficient protection on further exposure to the

These polypeptides have particular appliacation in the treatment of gastrointestinal disorders associated with disruption of the gastrointestinal epithelium or villi such as chemotherapy- and radiation-therapy induced enteritis (gut toxicity), mucositis, peptic ulcer disease, gastroenteritis and colitis, villus atrophic disorders, malignancy and inflammatory bowel disease. BTF polypeptides may also be useful in the treatment of human immunodeficiency virus (HTV) and HTV-associated disease due to their abillity to stimulate CD4+ and CD8+cells. Biologically active ETF may be used to treat a variety of other diseases or conditions where T-cell or B cell stimulation is desired.

The invention relates to an isolated antibody that binds specifically to a similan or human epithelium-derived T-cell factor (ETF) polypeptide. The antibodies are used, optionally when immobilized or labeled, to detect and quantify ETF in standard immunosasays. They may also be used as diagnostic and therapeutic agents, e.g. when conjugated to toxins (or their precursors) or radionuclides. ETF induces prolliferation and/or differentiation of T cells (or their precursors), e.g. for use in certablishing long term in vitro cultures; and is also used to treat gastrointestinal disease (e.g. enteritis or mucositis induced by chemotherapy or radiation, peptide ulcer, gastroenteritis, colitis, villus atrophy, malignancy and inflammatory bowel disease, to treat human immune deficiency virus infection or associated disease, or generally in any struation requiring stimulation of T or B cell compressed anti-infection of immunoglobulins or certain cytokines, increased anti-infection of tumour or virus-infected cells. The presents a DNA encoding a simian ETF precursor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

This sequence represents the human interleukin 15 (IL-15) nucleotide sequence. The IL-15 nucleotide sequence and the protein encoded by it can be used to determine and create antagonists of IL-15. An antagonist of IL-15 can be used for treating an inflammatory bowel disease (IBD). The Invention relates to the treatment of cellac disease using IL-15 antagonists. The antagonists are preferably mutehns of IL-15, antibodies against IL-15 or IL-15 molecules bound to chemical groups that interfere the ability of IL-15 to effect a signal transduction through either the alpha or the gamma subunit of the IL-15 receptor complex. The IL-15 antagonists of the invention can be used to treat irritable bow disease
                                                                                                                                                                                                                                                                                                                                                         treating an inflammatory bowel

For is a previously unidentified T-cell growth factor which stimulates precursor or mature CD4 and CD8+ T-lymphocytes to proliferate and differentiate. It also promotes proliferation of the gastrointestinal epithelium. The protein can be used to promote long-term in vitro culture of T-lymphocytes and T-cell lines. ETF can be used for treating HIV infection, HIV-associated diseases, and other diseases or conditions where stimulation of T-cell proliferation would be desirable e.g., it

could be used to augment the destruction of tumour cells or virally-infected cells. ETF may also be used to treat or prevent gastrointestinal disease, including chemotherapy and radiotherapy associated enteritis, gastroenteritis, colitis, inflammatory bowel disease and villus atrophic disorders. Chemotherapy and radiotherapy associated enteritis (gut choxicity) results in bleeding and sepsis due to gastrointestinal flora entering the blood, and thus can limit the dosage of therapeutic agent administered to a cancer patient. ETF may therefore be used to increase the tolerated doses radiotherapy and chemotherapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; interleukin 15; IL-15; gene therapy; chromosome 4q31; infection;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is human interleukin-15 (IL-15) DNA coding sequence located on chromosome 4931. The polymorphic variants of IL-15 genes are useful for studying the expression and function of IL-15 and expressing IL-15 protein for use in screening for candidate drugs to treat diseases covered in the period of IL-15 publication of IL-15 activity. Genotyping or haplotyping an individual at the covel IL-15 polymorphic sites are useful for studying population diversity, anthropological lineage the significance of diversity and clineage of the phenotypic level, patternity testing, forensic applications differentifying associations between IL-15 genetic variation and a trait such as level of drug response or usceptibility to disease.

Infections human immundeficiency virus and T-cell leukemia. The infections, human immundeficiency virus and T-cell leukemia. The dentification of an association between a clinical response and a genotype or haplotype (or haplotype pair) for the IL-15 gene may be the basis for designing a diagnostic method to determine those individuals who will or will not respond to the treatment, or alternatively, will respond at a lower level and thus may require more treatment, i.e. a construct on a level of a drug The genotyping or haplotyping and those are also useful for developing drugs targetting IL-15. The genotyping and the application of an iL-15 isogene and also in gene the arrange of function of an IL-15 isogene and also in gene the arrangement of an iL-15 isogene may be turned off by transforming that a targetted organ, tissue or cell population of an expression of an arrangement of a drag of an expression of an arrangement of an a

           The invention relates to simian and human epithelium-derived T-cell polypeptides. Antibodies that specifically bind to the ETF polypeptides are used for treating or preventing gastrointestinal diseases, such as chemotherapy and radiation therapy-induced enteritis and mucositis, peptic ulcer disease, villus atrophic disorders and inflammatory bowl disease; for increasing tolerated doses for radiation therapy and chemotherapy agents which are limited by gastrointestinal therapy and chemotherapy agents which are limited by gastrointestinal antibodies are further used to treat a variaty of other diseases or conditions where it is desired to stimulate proliferation of T-lymphocytes and B lymphocytes, or the secretion of immunoglobulin B lymphocytes, to augment the destruction of tumour cells infected with virus. The present sequence represents a cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CTAAACAGTCATTTTCTAACTGAAGCTGGCATTCATGTCTTCATTTTGGGCTGTTTCAGT 120

The present sequence describes an isolated RNA molecule which specifically cleaves mRNA encoding interleukin 15 (IL-15). The enzymatic RNA molecules can bind to and cleave mRNA encoding IL-15. They can be used for treating disorders associated with IL-15 such as inflammatory disorders, e.g. rheumatoid arthritis by inhibiting the synthesis of IL-15 in lymphocytes and preventing the recruitment and activation of macrophages. They can also be used to develop transgenic animals which can be used to identify the impact of increased or decreased IL-15 levels on a particular pathway or phenotype. The present sequence represents a human IL-15 DNA sequence.

The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense oligonucleotides the A is replaced by a "Universal" or alternative base. (I) can have respiratory, bronchodilator, antinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down regulate the expression and or activity of target polypeptides associated with lung/respiratory disorders and mallianancies, such as stimulating and activating peptide factors and transmitters, transcription factors, immunodiobulins and antibodaes, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adhesion molecules and their receptors, cytokine and chemokine receptors, adenosine receptors, bradykinin receptors, central nervous system (CNS) and peripheral nervous and non-nervous system creeptors, adenosine receptors, bradykinin receptors, central nervous system (CNS) and peripheral nervous and non-nervous system creeptors, binding proteins and mallianancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction and/or surfactant hypoproduction which are associated with a disease of and/or surfactant hypoproduction, respirator, inflammation, and/or surfactant hypoproduction, respirator, inflammation, and/or systic fibrosis (CF), allergic rhinitis (AR), pulmonary (CRP), palm, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary transplantation rejection, pulmonary infections, bronchitis,
                                                                                                                                                                                                                      Low adenosine antisense oligonucleotide, phosphorothioate; allergy; human; airway disorder; bronchoconstriction; lung inflammation; surfactant depletuo; respiratory; bronchodilator; antinflammatory; immunosuppressive; antiasthmatic; analgesic; hypotensive; cytostatic; respiratory obstruction; pulmonary obstruction; impeded respiration; surfactant hypoproduction; pulmonary vasoconstriction; asthma; RDS; respiratory distress syndrome; pain; cystic fibrosis; allergic rhinitis; pulmonary hypertension; emphysema; pulmonary transplantation rejection; chronic obstructive pulmonary disease; pulmonary infection; bronchitis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions -
                                                                                                                                                                               Human low adenosine antisense oligonucleotide related seguence #2909.

AAAS8037) capable of inhibiting the expression of the interleukin-15 (IL-15) by hybridising to IL-15 mRNA (AAAS8044). IL-15 is a member of the short chain, 4 alpha helix bundle cytokine family and is a potent T-cell growth factor and activator. IL-15 acts as a stimulator of various T-cell mediated pathological immune responses, such as autoimmune disorders (e.g., rheumatoid arthritis, graft versus host disease and organ transplant rejection), and has a proinflammatory role in rheumatoid arthritis synovitis. The antisense oligonucleotides are useful for inhibiting IL-15 production and are thus useful for alleviating inflammatory polyarthopathy associated with rheumatoid arthritis, organ transplant rejection (e.g., kidney transplant rejection; cell transplant rejections, asthma, lupus erythematosus and inflammatory bowel disease. The present sequence represents a cDNA copy of human in the man and in the man of th

The present invention describes a new composition comprising an antisense oligonucleotide (ON) with low adenosine (up to 15%), which targets nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergic, andiasthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, antiathmation, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating effects afflict the lungs of a subject. They can be used for treating of a subman, impeded respiration, respiratory distress syndrome, pain, cystic fubrosis, pulmonary hypertension, emphysema, chronic obstructive culmonary disease (COPD), and cancers such as leukaemias, lymphomas, carcinomas, and cancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the ONs reduces side effects. The A-containing ONS break down with the release of deoxyadenosine which activates adenosine receptors causing bronch constriction and inflammation. AAA32313 to AAA33312 represent the nucleotide sequences given in the sequence listing from the present convent content of invention, which correspond to SEQ ID NO:1 to 2815, and then the last content of the adenosine receptors causing invention, which correspond to SEQ ID NO:1 to 185, but the sequences

This invention describes novel antisense oligonucleotides of 8-40 nucleic acids, targeted to interleukin-15 (IL-15). The products of the invention have anti-ILIA, anti-Inflammatory, hepatotropic, anti-arthritic, neuroprotective, antiproliferative and antiulcer activity and can be used for gene therapy. The antisense oligonucleotides are used to inhibit interleukin-15 (IL-15) expression and production, and prevent the recruitment and activation of macrophages. They are used to treat diseases associated with an increased expression of IL-15. Such diseases include inflammatory disorders, such as inflammatory bowel disease, arthritis, cirrhosis, multiple sclerosis, chronic liver disease, arthritis, cirrhosis, multiple sclerosis, chronic liver disease, in vivo or ex vivo. The antisense oligonucleotides of the invention are specific for interleukin-15 (IL-15), and can be delivered exogenously or can be expressed from DNA or RNA vectors. This sequence encodes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            be

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense oligonucleotides the A is replaced by a 'universal' or alternative base. (I) can have respiratory, bronchodiator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polyapetides associated with activity of target polyapetides associated with activity and papetide factors and malignancies, such as stimulating and activity and antiboddy receptors, cytokines and activity produced specific and non-specific enzymes, immunoglobulins and antiboddes, antibody receptors, cytokines and chemokine receptors, adenosine neceptors, bradykinin receptors, central nervous system (CNS) and peripheral nervous and non-nervous system peptide transmitters, defensins, growth faltotors, vasoactive peptides and receptors, binding proteins and malignancy associated proteins. The anticulating respiratory obstruction (especially pulmonary obstruction and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or surfactoral physoroduction which are associated with a disease or condition and or condition and or condition and condition and condition and conditions.
                                                                                                                                                                                                                                                                                           Low adenosine antisense oligonucleotide; phosphorothioate; allergy; human; airway disorder; bronchoconstriction; lung inflammation; surfactant depletion; respiratory; bronchodilator; antihinflammatory; immunosuppressive; antiasthmatic; analgesic; hypotensive; cytostatic; respiratory obstruction; pulmonary obstruction; impeded respiration; surfactant hypoproduction; pulmonary vasoconstriction; asthma; RDS; respiratory distress syndrome; pain; cystic fibrosis; allergic rhinitis; pulmonary hypertension; emphysema; pain; cystic fibrosis; allergic rhinitis; cannot obstructive pulmonary disease; pulmonary infection; bronchitis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               infections, bronchitis,

AAF18434 to AAF21543 represent human polynucleotide
```

```
This DNA encodes a wild type interleukin-15 (IL-15) polypeptide. This wild-type sequence can be mutated at codon positions 149 and 156 to create a mutant IL-15 polypeptide. The mutant polypeptide is at least of dentical to wild-type IL-15 and is capable of inhibiting at least one of the cellular events that normally occurs when wild-type IL-15 specifically binds to a cell surface receptor. The mutant IL-15 is used for suppressing the immune response in a patient. It can be used for treating autoimmune diseases such as rheumatic arthritis, type I diabetes or a rheumatic disease selected from systemic lupus erythematosus (SLE), Slogren's syndrome, scleroderma, mixed connective tissue disease. Carantopositis, polymyositis, Reiter's syndrome and Behcet's disease. Carantopositis, polymyositis, Reiter's syndrome and Behcet's disease. Carantopositis, myasthenia gravis, encephalomyelitis, avariety of pemphigus, psoriasis, inflammatory bowel disease, AIDS and vascular injury. The mutant IL-15 can also be used for reducing the viability of a cell that expresses a IL-15 receptor. It can also be used to diagnose
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /note= "the codon CAG encoding Gln can be substituted by a codon encoding Asp"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          g
```

```
This DNA encodes a mutant interleukin-15 (IL-15) polypeptide. The wild-type IL-15 sequence was mutated at codon positions 149 and 156 to create this mutant IL-15 polypeptide. This mutant polypeptide is at least

```

Homo sapiens

```
90% identical to wild-type IL-15 and is capable of inhibiting at least one of the callular events that normally occurs when wild-type IL-15 pecifically binds to a cell surface receptor. The mutant IL-15 is used for suppressing the immune response in a patient. It can be used for treating autoimmune diseases such as rheumatic arthritis, type I diabetes or a rheumatic disease selected from systemic lupus erythematosus (SLE), Slogren's syndrome, scleroderma, mixed connective tissue disease, dermatomycostiis, polymycostiis, Reiter's syndrome and Behcer's disease. It can also be used to treat Hashimoto's thyroiditis, Grave's disease, multiple sclerosis, myasthenia gravis, encephalomyelitis, a variety of pemphigus, psoriasis, inflammatory bowel disease, AIDS and vascular injury. The mutant IL-15 can also be used for reducing the viability of a cell that expresses a IL-15 receptor. It can also be used to diagnose a disease treatable with an IL-15 antagonist.

```
antisense oligonucleotide (ON) with low adenosine (up to 15%), which targets nucleic acids involved in bronchoconstriction, allergies, and/or targets nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergic.

Contiasthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, impaired allways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, pain, cystic fibrosis, pulmonary pypertension, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, memphysem, chronic obstructive pulmonary disease (COPD), and cancers such as leukaemias, lymphomas, carcinomas, and cancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the olvs reduces side effects. The A-containing ONS break down with the release of decoyadenosine which activates adenosine receptors causing bronchoconstriction and inflammation. AAA32313 to AAA33312 represent the nucleotide sequences given in the sequences. SEQ ID NO:11 to 186; but the sequences of differ from the previously named sequences. SEQ ID NO:11 to 186; differ from the prevent claimed ONS from the present in the invention of the present clayers. In the sequences of the prevent clayers of the once match up with their corresponding SEQ ID NO: Sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            105 TTTGGGCTGTTTCAGTGCAGGGCTTCCTAAAACAGAAGCCAACTGGGTGAATGTAATAAG 164

The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense oligonucleotides the A is replaced by a "Universal" or alternative base. (I) can have respiratory, bronchodilator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with unig/respiratory disorders and malignancies, such as stimulating and activating peptide factors and transmitters, transcription factors, immunoglobulins and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adhesion molecules and their receptors, cytokine and chemokines, enceptors, adenosine receptors, bradykinin receptors; central nervous system (CNS) and peripheral nervous and non-nervous system receptors, CNS and peripheral nervous and non-nervous system receptors, cransmitters, defensins, growth factors, vasoactive peptides and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Low adenosine antisense oligonucleotide; phosphorothioate; allergy; human; airway disorder; bronchoconstriction; lung inflammation; surfactant depletion; respiratory; bronchodilator; antihinflammatory; immunosuppressive; antiasthmatic; analgesic; hypotensive; cytostatic; respiratory obstruction; pulmonary obstruction; impeded respiration; surfactant hypoproduction; pulmonary vasoconstriction; asthma; RDS; respiratory distress syndrome; pain; cystic fibrosis; allergic rhinitis; pulmonary hypertension; emphysema; pulmonary transplantation rejection; chronic obstructive pulmonary disease; pulmonary infection; bronchitis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions -

The present invention describes a new composition comprising an antisense oligonucleotide (ON) with low adenosine (up to 15%), which antisense oligonucleotide (ON) with low adenosine (up to 15%), which cargines nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergic.

Cusful for the treatment of diseases associated with inflammation, antiasthmatic, cytostatic and analgesic activities. The compositions are impaired airways, including lung disease and diseases whose secondary of a subject. They can be used for treating effects afflict the lungs of a subject. They can be used for treating confitions, pulmonary vasconstriction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic ibrosis, pulmonary hypertension, emphysema, chronic obstructive cartinomas, and cancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the ONS reduces side effects. The A-containing ONS break down with the release of deoxyadenosine which activates adenosine content of the onchoconstriction and inflammation. AAA33313 to AAA35312 represent the nucleotide sequences given in the sequence listing from the present convention, which correspond to SEQ ID NO:11 to 1885, but the sequences differ from the previously named sequences. SEQ ID NO:11 to 1680

(AAA32331 to AAA33923 are specifically claimed ONS from the present convention N.B. Sequences given in the disclosure of the present convention do not match up with their corresponding SEQ ID NO: sequences convention and provided sequences of the present convention of the match up with their corresponding SEQ ID NO: sequences convention.
                                                                                                                                                                                                           New antisense oligonucleotides useful for treating e.g. pulmonary vasoconstriction, inflammation, allergies, asthma, hypertension, bronchitis, emphysema, respiratory distress syndrome, ischemia or

Both the simian and the human ORFs encode a precursor polypeptide (AAR843436, AAR83438). The precursor polypeptides at 48-AA leader sequence and a sequence encoding mature simian or human IL-15 polypeptides. The active simian and human IL-15 polypeptides are disclosed in AAR83309 & AAR83310 respectively. The invention also comprises other mammalian IL-15, including human IL-15, that hybridise to probes defined by CDNA was deposited with ATCC on Feb. 1993 under ATCC 69245. The deposit was named 141-hrFF. AAR83438 is a mammalian manual the recombinance of human IL-15.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  264

It is a generic sequence which encompasses both
AAR83309 (simian) and AAR83310 (human) IL-15 mature polypeptides.
                                                                                                       Interleukin-15; epithelium-derived T-cell factor; T lymphocyte; ss
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Isolated DNA encoding polypeptide with mammalian IL-15 activity stimulates proliferation and differentiation of T cells, used for treating carcinoma(s), melanomas, etc. and viral infections

                                                                                                                                                                                                                                                                                                                                                                       δ
                                                                                                                                                                 g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to simian and human epithelium-derived T-cell factor (ETF) polypeptides. Antibodies that specifically bind to the ETF polypeptides are used for treating or preventing gastrointestinal diseases, such as chemotherapy and radiation therapy-induced enteritis and mucositis, peptic ulcer disease, villus atrophic disorders and inflammatory bowel disease; for increasing tolerated doses for radiation therapy and chemotherapy agents which are limited by gastrointestinal toxicity; and for treating HIV and HIV-associated diseases. The antibodies are further used to treat a variety of other diseases or conditions where it is desired to stimulate proliferation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antibodies that specifically binds epithelium-derived T-cell factor polypeptide useful for e.g. treating or preventing gastrointestinal diseases, HIV and HIV-associated diseases, augmenting destruction of
